one machine, a screen that will display the contents of whatever electronic card you feed it.

I cite Zich's views at some length here because he is not some Silicon Valley research and development visionary, but a highly placed executive at what might be called, in a very literal sense, our most conservative public institution. When men like Zich embrace the electronic future, we can be sure it's well on its way.

Others might argue that the technologies cited by Zich merely represent a modification in the "form" of reading, and that reading itself will be unaffected, as there is little difference between following words on a pocket screen or a printed page. Here I have to hold my line. The context cannot but condition the process. Screen and book may exhibit the same string of words, but the assumptions that underlie their significance are entirely different depending on whether we are staring at a book or a circuit-generated text. As the nature of looking—at the natural world, at paintings—changed with the arrival of photography and mechanical reproduction, so will the collective relation to language alter as new modes of dissemination prevail.

Whether all of this sounds dire or merely "different" will depend upon the reader's own values and priorities. I find these portents of change depressing, but also exhilarating—at least to speculate about. On the one hand, I have a great feeling of loss and a fear about what habitations will exist for self and soul in the future. But there is also a quickening, a sense that important things are on the line. As Heraclitus once observed, "The mixture that is not shaken soon stagnates." Well, the mixture is being shaken, no doubt about it. And here are some of the kinds of developments we might watch for as our "proto-electronic" era yields to an all-electronic future:

1. **Language erosion.** There is no question but that the transition from the culture of the book to the culture of electronic communication will radically alter the ways in which we use language on every societal level. The complexity and distinctiveness of spoken and written expression, which are deeply bound to traditions of print literacy, will gradually be replaced by a more telegraphic sort of "plain speech." Syntactic masonry is already a dying art. Neil Postman and others have already suggested what losses have been incurred by the advent of telegraphy and television—how the complex discourse patterns of the nineteenth century were flattened by the requirements of communication over distances. That tendency runs riot as the layers of mediation thicken. Simple linguistic prefab is now the norm, while ambiguity, paradox, irony, slytety, and wit are fast disappearing. In their place, the simple "vision thing" and myriad other "things." Verbal intelligence, which has long been viewed as suspect as the act of reading, will come to seem positively conspiratorial. The greater part of any articulate person's energy will be deployed in dumbing down her discourse.

Language will grow increasingly impoverished through a series of vicious cycles. For, of course, the usages of literature and scholarship are connected in fundamental ways to the general speech of the tribe. We can expect that curricula will be further streamlined, and difficult texts in the humanities will be pruned and glossed. One need only compare a college textbook from twenty years ago to its contemporary version. A poem by Milton, a play by Shakespeare—one can hardly find the text among the explanatory notes nowadays. Fewer and fewer people will be able to contend with the so-called masterworks of literature or ideas. Joyce, Woolf, Soyinka, not to mention the masters who preceded them, will go unread, and the civilizing energies of their prose will circulate aimlessly between closed covers.

2. **Flattening of historical perspectives.** As the circuit supplants the printed page, and as more and more of our communications involve us in network processes—which of their nature plant us in a perpetual present—our perception of history will inevitably alter. Changes in information storage and access are bound to impinge on our historical memory. The depth of field that is our sense of the past is not only a linguistic construct, but is in some essential way represented by the book and the physical accumulation of books in library spaces. In the contemplation of the single volume, or mass of volumes, we form a picture of time past as a growing deposit of sediment; we capture a sense of its depth and dimensionality. Moreover, we meet the past as much in the presentation of words in books of specific vintage as we do in any isolated fact or statistic. The database, useful as it is, expunges this context, this sense of chronology, and admits us to a weightless order in which all information is equally accessible.

If we take the etymological tack, history (cognate with "story") is affiliated in complex ways with its texts. Once the materials of the past are unhoused from their pages, they will surely mean differently. The printed page is itself a link, at least along the imaginative continuum, and when that link is broken, the past can only start to recede. At the same time it will become a body of disjunct data available for retrieval and, in the hands of our canny dream merchants, a mythology. The more we grow rooted in the consciousness of the now, the more it will seem utterly extraordinary that things were ever any different. The idea of a farmer plowing a field—an historical constant for millennia—will be something for a theme park. For, naturally, the entertainment industry, which reads the collective unconscious unerringly, will seize the advantage. The past that has slipped away will be rendered ever more glorious, ever more a fantasy play with heroes, villains, and quaint settings and props. Small-town American life returns as "Andy of Mayberry"—at first enjoyed with recognition, later accepted as a faithful portrait of how things used to be.

3. **The wanting of the private self.** We may even now be in the first stages of a process of social collectivization that will over time all but vanquish the ideal of the isolated individual. For some decades now we have been edging away from the perception of private life as something opaque, closed off to the world; we increasingly accept the transparency of a life lived within a set of systems, electronic or otherwise. Our technologies are not bound by season or light—it's always the same time in the circuit. And so long as time is money and money matters, those circuits will keep humming. The doors and walls of our habitations matter less and less—the world sweeps through the wires as it needs to, or as we need it to. The monitor light is always blinking; we are always potentially on-line.
